## Central Arkansas ALPR Audit Findings Comparison

**Prepared:** August 12, 2026

**Jurisdictions:** Cabot, Jacksonville, Little Rock, Pulaski County, and Sherwood

**Scope:** Comparison of the separate records-based evaluations. The source periods, systems, and records are not identical, so the figures should not be used as a simple performance ranking.

### Executive conclusion

No reviewed jurisdiction provides every element needed for a fully reproducible public ALPR audit. Each supplies a different piece of the accountability picture:

- **Cabot** has a strong Arkansas-oriented policy, public six-month reports, and a supporting workbook, but the 2025 workbook materially conflicts with the public memorandum.
- **Jacksonville** produced a detailed search-level audit and a network-participation page, but its policy lacks recurring-audit and six-month-report clauses.
- **Little Rock** produces monthly, quarterly, semiannual, statutory, and audit reports, but the reports do not reconcile and the public audit memorandum lacks methodology and workpapers.
- **Pulaski County** has a 2021 Arkansas policy and a later Virginia-based policy that conflict; its short-period reports omit required outcomes and are mislabeled as six-month reports.
- **Sherwood** produced unusually large user and network exports, but network inclusion must not be confused with actual result access, and capped exports, missing workpapers, and incomplete case linkage prevent compliance certification.

### Comparison matrix

| Review area                  | Cabot                                           | Jacksonville                                                                       | Little Rock                                                            | Pulaski County                                                   | Sherwood                                                     |
|------------------------------|-------------------------------------------------|------------------------------------------------------------------------------------|------------------------------------------------------------------------|------------------------------------------------------------------|--------------------------------------------------------------|
| Written policy               | Strong Arkansas statutory core                  | Useful operational policy; reporting/audit omissions                               | Strong hotlist and quarterly-audit concepts; some conditional controls | Two conflicting policies; 2025 policy applies Virginia law       | Strong prohibited-use and hit-disposition provisions         |
| Public statistical reporting | Two six-month reports reviewed                  | Prior statistical figures summarized; source report not re-audited in selected set | Extensive monthly/Q2/semiannual reports                                | Two short overlapping reports labeled six-month                  | No six-month report identified in selected set               |
| Search-level records         | 469-row public CSV                              | 267-row audit PDF                                                                  | Audit summary, not underlying query population                         | Not supplied                                                     | 1,502 displayed user-audit IDs plus public portal analysis   |
| Network evidence             | Query network counts in CSV                     | 349 configured outside organizations                                               | Custom/non-owned hotlist alert totals                                  | Non-owned custom-alert totals                                    | Multi-million-row network-inclusion exports                  |
| Principal data-quality issue | 2025 scan and false-hit totals do not reconcile | Flattened PDF and incomplete visible case linkage                                  | Monthly/Q2/semiannual totals conflict                                  | Wrong-state policy and incomplete reporting                      | Export-capacity limits and incomplete result-access evidence |
| Outcome reporting            | Uses statutory categories; case support absent  | Prior aggregate figure; underlying report needed                                   | Missing identifiable non-correlation and prosecution counts            | Expressly says outcomes are not tracked                          | Six-month outcome report not identified                      |
| Audit methodology            | No policy audit schedule                        | No policy audit schedule                                                           | One-page conclusion lacks population/sample/workpapers                 | 2025 policy requires monthly 5% samples; workpapers not supplied | Annual audits required; workpapers not identified            |

## Quantitative findings that should not be conflated

| Jurisdiction   | Verified record observation                                                                 | Proper interpretation                                                                   |
|----------------|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Cabot          | 7,023,170 scans and 279 alerts reported for Jan.-June 2025; workbook totals 7,555,734 scans | A reporting reconciliation problem, not proof that either figure is intentionally false |
| Jacksonville   | 267 search IDs; median scope 22 networks; nine over 5,000                                   | Search scope, not number of results or agencies whose data was used                     |
| Little Rock    | 103,375,512 scans and 350,211 alerts labeled confirmed                                      | Very high volume; alert/confirmation definitions remain unclear                         |
| Pulaski County | 504,711 scans and 1,762 alerts over a 70-day report labeled six-month                       | Short-period system activity, not a complete six-month statutory report                 |
| Sherwood       | May and June network files each contain 1,048,575 rows                                      | At least that many network-inclusion records; completeness cannot be assumed            |

## **Recurring accountability gaps**

### **1. Alerts are not consistently distinguished from verified matches**

Several reports use alert, hit, and confirmed match interchangeably. A defensible statewide report should separately count:

1. automated alerts;
2. visual plate/vehicle confirmations;
3. database-status confirmations;
4. non-correlating alerts;
5. investigative uses;
6. stops;
7. arrests;
8. filed prosecutions; and
9. final dispositions.

### **2. Outcome categories are incomplete or unreconciled**

- Little Rock does not identify a non-correlation count or a true arrest-and-prosecution count.
- Pulaski County states that it does not track those outcomes.
- Cabot uses the statutory categories but its workbook and memorandum conflict.
- Jacksonville's underlying six-month report is needed for independent verification.
- Sherwood's required report was not identified in the selected record set.

### **3. Search reasons do not always provide case linkage**

Generic terms such as Investigation, Traffic, acronyms, and blank fields can reflect a lawful purpose while still being inadequate for independent audit. Statewide minimum fields should include a controlled reason, case/CAD reference or documented exception, requesting agency, search scope, result sources, views/downloads, and disposition.

### **4. Network configuration is not actual access**

Configured access, number of networks searched, and a network-audit row are different from an image being returned, viewed, downloaded, exported, or used. Public reporting should keep those events separate.

### **5. Audit conclusions lack reproducible workpapers**

A public statement of full compliance or a policy promise of periodic audits is not a reproducible audit. A defensible summary should identify:

- audit period and population;
- user and query counts;
- sample size and method;
- controls tested;
- exceptions and corrections;
- reviewer and approval;
- supporting workpapers; and

- follow-up verification.

## **Minimum public audit standard**

The records support a common minimum framework:

1. Fixed six-month reporting periods and publication dates.
2. A statewide data dictionary for every required metric.
3. Separate raw alerts, verified matches, non-correlations, stops, arrests, filed prosecutions, and final outcomes.
4. Actual hotlist names, owners, legal predicates, activation dates, expiration dates, and removal audits.
5. Stable pseudonymous user identifiers in public search audits.
6. Query reason plus case/CAD linkage or a documented exception.
7. Separate counts for network scope, returned results, views, downloads, exports, and dissemination.
8. Native machine-readable public data with a redacted human-readable summary.
9. Export manifests, extraction timestamps, revision histories, and SHA-256 hashes.
10. Recurring documented audits with published methodology, exception counts, corrective actions, and certification.

## **Bottom line**

The records do not support a simple conclusion that one agency's program is lawful, unlawful, effective, or ineffective. They do support a narrower and stronger conclusion: Central Arkansas agencies are operating comparable technology under inconsistent policies, definitions, audit practices, and public-reporting methods. Standardized statewide controls would make both law-enforcement use and public accountability more reliable.

## **Evaluations incorporated**

- Cabot ALPR Audit Evaluation, August 12, 2026.
- Jacksonville ALPR Audit Evaluation, August 12, 2026.
- Little Rock ALPR Reports and Q2 Audit Evaluation, August 12, 2026.
- Pulaski County ALPR Audit Evaluation, August 12, 2026.
- Sherwood ALPR Audit Evaluation, August 12, 2026.
- Central Arkansas ALPR Policy Comparison, August 12, 2026.

This report is a records and governance analysis, not legal advice or a finding of misconduct.
